

Qualcomm's Second Generation 5G mmWave Chipset, from Modem to Antenna

A study of the complete second generation of the 5G millimeter-wave chipset for handset applications, including the baseband modem SDX55M, the transceiver SMR526 and Antenna-on-Package QTM525.

The 5G revolution is here. We are currently seeing uptake of the technology led by the Sub-6GHz frequency range application. Qualcomm, one of the major players in this segment, has claimed over 230 design wins in development or already launched on the market. Only a small fraction of these smartphones is 5G millimeter wavelength (mmWave) range compatible, mainly represented by Samsung. Last year, Samsung released its mmWave version of its flagship Galaxy S10 5G in America in partnership with Qualcomm, which supplies the complete chipset. This year, Samsung renewed the partnership and is offering the latest generation of Qualcomm's 5G mmWave chipset in its Galaxy S20 Ultra 5G.

Two versions of the antenna modules are integrated into the flagship. The first version comes with a dipole antenna coupled with a patch antenna system. The patch antenna system is designed to provide wide-band polarized radiation. Among the innovations in the antenna design, Qualcomm seems to integrate two types of antenna patch in the same form factor. One is a Coupled Feed Antenna, and one is a Dual-Polarized and Dual Band Patch Antenna. Moreover, the design in the routing, in the filtering and in the transceiver has led to a better stability in terms of power emission.

This report includes a full investigation of the system, featuring a detailed study of the SiPs, including die analyses, processes and board cross-sections. It contains a complete cost analysis and a selling price estimation of the system. Finally, it features a technical and cost comparison with the structure of the first generation of 5G mmWave chipset from Qualcomm.

Like the previous generation, the complete solution has been especially designed for smartphone applications, starting with Samsung and expected to spread to others designs. The module in the Samsung Galaxy S20 Ultra 5G comes with five systems spread throughout the smartphone. The first System-in-Package (SiP) is the baseband processor, which uses standard Ball Grid Array (BGA) SiP Packaging. The second is the 5G mmWave receive/transmit (Rx/Tx) which uses standard flip-chip ball grid array (FCBGA) packaging. The other systems are combined in the antenna-on-package (AoP) module, which is spread around the corner of the smartphone in order to provide spherical coverage without any hand-blocking constraints.
